regis.lebrun@airbus.com

Developers training

Objectives

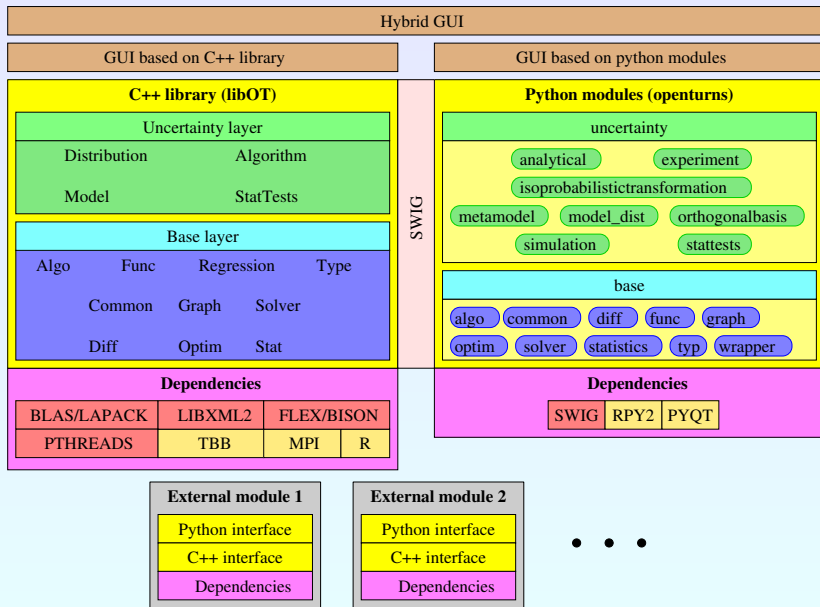

The objectives of this course is to give a broad overview of the OpenTURNS project and the resulting platform. We will cover the following points:

- The history of the project,
- The global organization of the platform,
- The multi-layer view of the library,
- The several usages of the platform.

2005-2019: 14 years of partnership

- 2005 Conception
- 2007 First release the 10th of May 2007. Python bindings.
- 2009 Multithreaded wrappers, polynomial chaos expansion.
- 2010 First windows port, parallelization.
- 2011 Sparse chaos implementation.
- 2012 v1.0, Stochastic processes
- 2013 Bayesian updating, matplotlib viewer
- 2014 Kriging, native windows support
- 2015 Vectorial kriging, HMat support
- 2016 Karhunen-Loeve process decomposition, NLopt bindings
- 2017 Canonical format low-rank tensor approximation, field functions
- 2018 Domains arithmetic, asymptotic Sobol' estimators, new simulation algorithms

The platform at a glance, developer's view

The big parts

- The **core** of the OpenTURNS platform is a **C++ library**, made of about 500 classes of various size. The library has a multi-layered architecture that is materialized by both the namespace hierarchy and the source tree.
- The **main user interface** is the **python module**, automatically generated from the C++ library using the wrapping software SWIG. It allows for a usage of OptnTURNS through python scripts of any level of complexity.
- The library relies on relatively **few dependencies** and most of them are optional.
- A service of **modules** is provided in order to extend the capabilities of the platform from the outside.
- Several **GUIs** have already been built on top of the C++ library or the Python module.

A multilayered library

The two main layers in the C++ library are the **Base** layer and the **Uncertainty** layer.

- **Base** layer: it contains all the classes not related to the probabilistic concepts. It covers the elementary data types (vectors as NumericalPoint, samples as NumericalSamples), the concept of models (NumericalMathFunction), the linear algebra (Matrix, Tensor) and the general interest classes (memory management, resource management);
- **Uncertainty** layer: it contains all the classes that deal with probabilistic concepts. It covers the probabilistic modelling (Distribution, RandomVector), the stochastic algorithms (MonteCarlo, FORM), the statistical estimation (DistributionFactory), the statistical testing (FittingTest)

A class in the Uncertainty layer can use any class in the Base or the Uncertainty layer.
A class in the Base layer can ONLY USE classes in the Base layer.

A monolythic library?

The C++ library is provided as a unique object file (libOT.so) created using the libtool technology. As such, it is a monolythic library (of about 8Mo stripped), but internally it is made of numerous sub-libraries, one for each folder in the source tree. A future objective is to modularize this library in order to speed-up both the compilation time and the loading time.

A parallel library

Some of the most time-consuming algorithms have been parallelized using the Thread Building Block technology (INTEL), a C++ library that allows for a parallelization of C++ code in a shared memory model. One of the objectives of OpenTURNS is the ability to execute external simulation softwares on large simulation models for a large amount of independent data sets. As such, OpenTURNS provides basic functionalities to distribute the executions of these simulations on a multiprocessors(cores) infrastructure using the low-level pthread technology or the TBBs.

Interfacing python and C++ libraries: SWIG

In order to provide a convenient interface to the user, the C++ library can be manipulated as a set of Python modules (18) that are organized through a hierarchy, on top of which stands the openturns module. The binding of the library is done almost automatically by SWIG (Simplified Wrapper Interface Generator) through a set of SWIG interface files.

An additional significant work has been made in order to ease the interaction between the OpenTURNS objects and the native Python objects.

A unique feature of the Python interface is the ability to wrap a Python function into an OpenTURNS concept of mathematical function, namely the NumericalMathFunction, using a specific class: the OpenTURNSPythonFunction. Using this mechanism, it is possible to address virtually all the scenarios of coupling with an external simulation software.

A linux platform that works on windows

The historic platform of OpenTURNS is linux. The first stage of developments have been made on 32 bits Intel Linux platforms (debian, mandriva), then the (minor) adaptations have been made in order to run on 64 bits Intel platforms as well.

Currently, the platform works on the following platforms:

- Debian 32 bits / 64 bits (Hetch to current);
- Mandriva 32 bits / 64 bits (2005 to current);
- Windows 32 bits / 64 bits (XP, Vista, seven).

The development platform remains Linux, the Windows version is obtain by cross compilation under Linux (using the mingw tools). A native Windows version is planed.

Compilation infrastructure

Two alternative compilation infrastructures are present: the historic one (autotools + libtools) and the newcomer (CMake). For now, only the first infrastructure is running smoothly. It covers:

- The detection and configuration aspects of the platform;
- The dependency management of the sources;
- The generation of parallel makefiles;
- The regression tests;
- The library packaging.

The use of the autotools also greatly simplify the Linux packaging (.deb, .rpm). The CMake infrastructure is still in a beta state, but should greatly improve the configuration and compilation steps, and provide a way to compile the Windows version using Microsoft compilers, in order to easily reuse the C++ library in native Windows projects.

Versioning system

The versioning system used for the development of the whole platform is Subversion (SVN), on top of which stands a TRAC website.

- **Apache Subversion** is a software versioning and a revision control system issued from the Apache project. It is used for both the sources of the platform and the documentation, as well as for the development of modules.
- **Trac** is an open source, web-based project management and bug-tracking tool. Trac allows hyperlinking information between a bug database, revision control and wiki content. It also serves as a web interface to several revision control systems including Subversion.

Repositories

Three repositories are used for the development of the platform, its documentation and its modules. This choice has been made for the following reasons:

- The time scale is not the same for these three activities;
- The teams are different partly in term of people, but mainly in term of expertise.

Platform repository

This repository is in charge of both the C++ library source code and the python interface. It has the following organization, which is quite standard:

- A trunk that stores the source code of the upcoming version of the platform. The rule is to have only source code that pass with success all the tests embedded with both the library and the python module.
- Several development branches, dedicated to contributors or to specific developments. There are currently 6 active branches.
- A branch for the tags with one entry for each release candidate or official releases. 17 releases have been tagged so far.

The usage of this infrastructure is described in the Contribution Guide, one of the several documents that come with the platform. In particular, a specific role is assigned to an **integrator**, in charge of the merges from the different branches into the trunk.

Documentation repository

This repository is in charge of the whole documentation of the platform (10 different documents). It has been separated from the main repository by the middle of 2009 in order to allow for more frequent updates of the documentation with respect to the whole platform. It shares the same structure as the main repository:

- A trunk that stores the source code of the upcoming version of the documentation. The rule is to have only LaTeX source code able to generate the PDF version of all the documents.
- Several documentation branches, dedicated to contributors. There are currently 3 active branches.
- A branch for the tags with one entry for each release of the documentation. 4 releases have been tagged since July 2009.

The usage of this infrastructure is the same as for the main repository.

Modules repository

This repository is dedicated to the development of extra functionalities that have not yet been integrated into the main library, due to the lack of maturity of their dependencies for example. This repository is organized in a different way than the previous repositories:

- There is a branch for each module
- Within these branches, **the same organization as the main repository is proposed** but the developers are free to organize the things the way they want. Nevertheless, the commitment to the standard organization should ease the future integration into the mainstream development.
- For now, there are 2 active modules and one template.

Trac interface: the timeline

The screenshot displays the OpenTURNS Trac interface, showing a list of tickets and changesets over time. The interface includes a navigation bar with links like 'Wiki', 'Timeline', 'Roadmap', 'Browse Source', 'View Tickets', and 'Search'. The 'Timeline' view is active, showing a list of tickets and changesets grouped by date. A sidebar on the right allows filtering changesets by date and type (opened, repository, milestones, wiki changes).

Timeline

03/04/11:

- 12:25 Ticket #299 (PythonMapping: unclosed files missing and namespace error for ...) created by roblaw
- 12:50 Ticket #298 (Missing J files in python/scholarship) closed by dufka
- 13:04 Changeset [1842] by dufka
- 13:04 Changeset in openturns [1842] by dufka
- 13:14 Changeset in openturns doc [1829] by schueller

03/07/11:

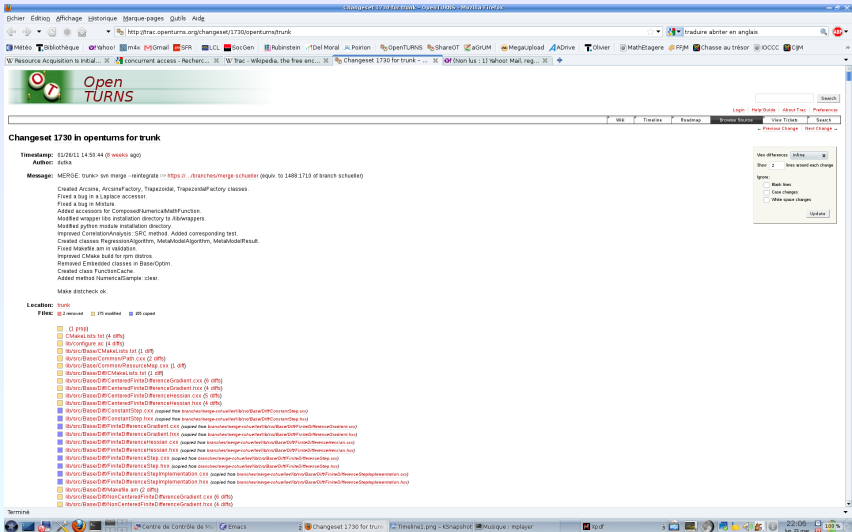

- 13:04 Changeset in openturns-modules [34] by roblaw
- 13:07 Ticket #298 (Missing J files in python/scholarship) created by roblaw

03/15/11:

- 17:04 Changeset [1839] by schueller
- 17:04 Changeset in openturns [1839] by schueller
- 12:04 Changeset [1838] by schueller

Trac interface: the bug tracking (1/2)

The screenshot displays the OpenTURNS Trac interface. At the top, there's a navigation bar with links like 'Bchier', 'Edition', 'Affichage', 'Historique', 'Marque-pages', 'Outils', and 'Aide'. Below this is a search bar and a list of active tickets. The main content area is divided into three sections: 'Active Tickets', 'Defect', and 'Task'. Each section contains a table of tickets with columns for Ticket, Summary, Component, Version, Milestone, Owner, Status, and Created. The 'Active Tickets' section shows tickets 4252 through 4259. The 'Defect' section shows tickets 4252 through 4259. The 'Task' section shows tickets 472 through 473. At the bottom, there's a footer with the OpenTURNS Consortium logo and the text 'OpenTURNS Developer Training'.

Trac interface: the bug tracking (2/2)

The screenshot displays the OpenTURNS Trac interface for ticket #299. The browser window title is "www.pythonwrappingfunctions.hxx missing and namespace error for XMLStorageManager when trying to compile a stream with OT (2018/11/29) - OpenTURNS - Mozilla Firefox". The address bar shows "http://trac.openturns.org/ticket/299". The OpenTURNS logo is at the top left. The ticket title is "Ticket #299 (new defect)" and "PythonWrappingFunctions.hxx missing and namespace error for XMLStorageManager when trying to compile ot-mixed with OT trunk (1842)". The ticket was created 3 days ago. The reporter is "richard.salle" and the owner is "dalle". The priority is "unspecified", the status is "new defect", the component is "extra module", and the version is "SVN#1842". The keywords are "C++". The description starts with "Hi," and "I am still trying to compile my module (ot-mixed 1.34) with trunk version of OT (1842). And I have two problems :". It then lists two issues: "it seems that PythonWrappingFunctions.hxx must be in the installed include files. Here a method to do that (I am not sure that it is the right method to do that)" and "after that I have the following error". The error messages are: "otmixed_wrap.cpp: In function 'void* p_OpenTURNS_Base_Common_XMLStorageM...'", "otmixed_wrap.cpp:16409: error: 'XMLStorageManager' is not a member of 'OpenT...", "otmixed_wrap.cpp:16409: error: expected primary-expression before '}' token", "otmixed_wrap.cpp:16409: error: expected '}' before 'x'", and "otmixed_wrap.cpp:16409: error: expected '}' before '}' token". The ticket has no attachments. The bottom of the screen shows a Windows taskbar with various icons and the system clock at 22:08 on June 25, 2019.

Ticket #299 (new defect)

PythonWrappingFunctions.hxx missing and namespace error for XMLStorageManager when trying to compile ot-mixed with OT trunk (1842) Created 3 days ago

Reported by: richard.salle Owned by: dalle

Priority: unspecified Status: new defect

Component: extra module Version: SVN#1842

Keywords: C++

Description

Hi,

I am still trying to compile my module (ot-mixed 1.34) with trunk version of OT (1842). And I have two problems :

- it seems that PythonWrappingFunctions.hxx must be in the installed include files. Here a method to do that (I am not sure that it is the right method to do that)

```
diff --git a/python/src/Makefile.am b/python/src/Makefile.am
--- a/python/src/Makefile.am
+++ b/python/src/Makefile.am
@@ -25,8 +25,8 @@ endif

otmixeddir = $(includedir)/openturns/otmixed
otmixedinclude_HEADERS = $(includedir)/openturns/otmixed
otmixedinclude_HEADERS += PythonWrappingFunctions.hxx
otmixedinclude_HEADERS += PythonNumericalMathEvaluationImplementation.hxx
otmixedinclude_HEADERS += PythonWrappingFunctions.hxx

BUILT_SOURCES = otmixed_run_time.hxx
plugin_sources = otmixed_run_time.hxx
```

after that I have the following error

```
otmixed_wrap.cpp: In function 'void* p_OpenTURNS_Base_Common_XMLStorageM...
otmixed_wrap.cpp:16409: error: 'XMLStorageManager' is not a member of 'OpenT...
otmixed_wrap.cpp:16409: error: expected primary-expression before '}' token
otmixed_wrap.cpp:16409: error: expected '}' before 'x'
otmixed_wrap.cpp:16409: error: expected '}' before '}' token
```

Any help will be appreciated to solve it. :)

Attachments

Terminal

- A quite mature project: 6 full years of development
- A structured (rigid ;-)?) development process
- A working infrastructure to help the developer in his/her hard job!
